

I'm not robot!

jQuery Bootstrap Fileinput Examples

The plugin will convert a simple HTML file input to an advanced file picker control. Will help fallback to a normal HTML file input for browsers not supporting JQuery or Javascript. The file input consists of the following three sections with options and templates to control the display: file caption section: to display a brief information of the file(s) selected file action buttons section: to browse, remove, and upload files. file preview section: to display the selected files on client for preview (supports preview of image, text, flash, and video file types). Other file types will be displayed as normal thumbnails. The plugin automatically converts an input with type = file to an advanced file picker input if you set its class = file. All options to the input can be passed as HTML5 data attributes. Ability to select and preview multiple files. Uses HTML 5 File reader API to read and preview files. Displays the progress of files being loaded onto the preview zone, in case many files are chosen. Ability to copy and paste files or images from the clipboard on to the fileinput plugin (just focus on the file caption name input and paste your clipboard content). Ability to drag and drop files or images on to the fileinput plugin. Offers predefined templates and CSS classes which can be changed to style your file-input display as per your needs. Ability to configure the plugin to show an initial preview of images/files with initial caption (more useful for record update scenarios). Refer the initialPreview, initialPreviewConfig, and initialCaption properties in the plugin options section for configuring this. Ability to zoom content as a detailed preview. See a slideshow of zoomed content in preview, maximize to borderless or fullscreen preview. Ability to sort/rearrange content in the initial preview via drag and drop. Ability to theme the widget entirely and control styling and layouts. Supports multi language widgets on same page through locales/translations. Option to show/hide any or all of the following: caption section preview section upload button remove button Customise the location of the target container elements to display the entire plugin, the caption container, the caption text, the preview container, preview image, and preview status. For text file previews, autowrap the text to the thumbnail width, and show a wrap indicator link to display complete text on hover. You can customize the wrap indicator (which defaults to ...). Customise the messages for preview, progress, and files selected. Upload action defaults to form submit. Supports an upload route/server action parameter for custom ajax based upload. Triggers JQuery events for advanced development. Events currently available are filefirst, fileclear, filecleared, fileloaded, and fileerror. Disabled and readonly file input support. Dynamically auto size the file captions for long file names exceeding container width. Raise new fileimageuploaded event that fires after image is completely loaded on the preview container. Autotize preview images when they exceed the size of the preview container. Completely templated and extensible to allow configuration of the file-input the way the developer wants. Preview intelligence based on various file preview types. The inbuilt file support types are categorized as image, text, html, video, audio, flash, object, and other. allowedPreviewTypes: You can now configure which all file types are allowed to be shown as a preview. This defaults to ['image', 'html', 'text', 'video', 'audio', 'flash', 'object']. Thus all file types are treated as an object to preview by default. For exampleTo preview only image and video, you can set this to ['image', 'video']. To disable content preview for all file-types and show the previewIcon instead as a thumbnail, set this to null, empty, or false. allowedPreviewMimeTypes: In addition to allowedPreviewTypes, you can also control which all mime types can be displayed for preview. This defaults to null, meaning all mime types are supported. >NOTE: With release 2.5.0 you can now control which file types or extensions are allowed for upload by setting allowedFileTypes and allowedFileExtensions. layoutTemplates: Allows you to configure all layout template settings within one property. The layout objects that can be configured are: main1, main2, preview, caption, and modal. previewTemplates: All preview templates for each preview type have been combined into one property, instead of separate templates for image, text etc. The keys are the formats as set in allowedPreviewTypes and values are the templates used for previewing. There are default prebuilt templates for each preview file type (generic, image, text, html, video, audio, flash, object, and other). The generic template is used only for displaying initialPreview content using direct markup. previewSettings: Allows you to configure width and height for each preview image type. The plugin has default widths and heights predefined for each type i.e image, text, html, video, audio, flash, and object. Replacing tags within templates has been enhanced. With this release it will automatically check for multiple occurrences of each tag to replace within a template string. Manipulate events and add your own custom validation messages easily by returning output to abort uploads in any of the other events. Support for translations and locales. Flash preview will require Shockwave flash to be installed and supported by the client browser. The flash preview currently works successfully with webkit browsers only. Video & Audio formats are however supported by all modern browsers that support the HTML5 video/audio tags. Note that browsers have limited number of video/audio formats supported by the HTML5 video element (e.g. mp4, webm, ogg, mp3, wav). The size of video files are recommended to be small (to be controlled through maxFileSize property) so that it does not affect the preview performance. You can copy a few files from the examples directory of this plugin repo, to test a few examples of flash and video files. I am trying to find an answer to this question: <http://stackoverflow.com/questions/40998287/krajee-bootstrap-file-upload-plugin-previewfileiconsettingsif> anyone uses this plugin i would appreciate any help on this matter. "body": "Want to give your users the ability to upload images from your Vue frontend, but don't know where to start? In this series, we'll step through the process from start to finish. We'll begin by prepping a Laravel app to store uploaded images. Then, using a battle-tested library called Filepond, we'll provide our Vue component with an area to drag and drop pictures to. Handling image data can be a bit complicated, especially when introducing another layer like a frontend framework. Using the libraries and techniques in this series though, I'll show you that it doesn't have to be a headache.", "thumbnail": "https://laracasts.nyc3.cdn.digitaloceanspaces.com/series/thumbnails/image-uploading-with-vue-and-laravel.png", "large_thumbnail": "https://laracasts.s3.amazonaws.com/series/thumbnails/social-cards/advanced-image-uploading-with-vue-and-laravel.png", "svgThumbnail": "https://laracasts.nyc3.cdn.digitaloceanspaces.com/series/thumbnails/svg/image-uploading-with-vue-and-laravel.svg", "slug": "advanced-image-uploading-with-vue-and-laravel", "episodeCount": "8", "difficultyLevel": "Intermediate", "customUri": null, "version": null, "version_notes": null, "complete": "1", "wallpaper": "https://laracasts.nyc3.digitaloceanspaces.com/series/wallpapers/Advanced-Image-Uploading-With-Vue-and-Laravel.zip", "archived": "0", "runTime": "59m", "taxonomy": {"name": "Frameworks", "path": "https://laracasts.com/browse/frameworks"}, "hasChapters": false, "isLarabit": "0", "isCreatorSeries": "0", "progress": {"started": false, "completionPercentage": "0", "episodesCompleted": "0", "completed": false, "nextEpisodePosition": "1", "lastUpdated": "Feb 20, 2022"}, {"id": "163", "className": "Laracasts\\Series", "title": "What's New in Laravel 9", "body": "Laravel 9 is here, and along with it comes a wide array of useful new features and tweaks.
